News No.: 1

Date: 27. February 2009

INVOLVES: Motor

Accessories

Starting September 2008, we have successfully introduced our improved series of 4" submersible motors.

Keeping all relevant parameters of the new motors as close as possible to the original ones, we are very pleased to have been able to minimize the impact of this change on our customers businesses. In fact, we have only gotten back positive comments from our customers, which is particularly true for our simultaneously introduced offering of 4" motors with preinstalled leads.

With this bulletin, we would like to remind our customers of the only change that has occurred in motor specifications - the **capacitor rating required** for the **0,75kW PSC** single phase motor:

0,75kW PSC motors datecoded 08J62 and later (model numbers 254 808 1621/ 254 818 1621 plus "L" models) require a 35 μ F / 450V rated capacitor to guarantee improved starting torque and running performance.

While tests show that the formerly specified 30 μ F capacitor is well suited to start and run the motor, using a 35 μ F capacitor will actually improve the starting torque.

Hoping this will assist you in servicing your applications even better, we thank you for your business and remain

With best regards

Franklin Electric Europa GmbH
